2.1.3.1 AMBIENT MONITORING PARAMETER SUMMARY-RINGSEND WWTP

The results for ambient results and additional monitoring data sets are included in the **Appendix 7.1 - Ambient Monitoring Summary.**

Significance of Results:

- The Ringsend WWTP was non-compliant with the ELV's set in the wastewater discharge licence as detailed in Section 2.1.2.
- The primary discharge from the wastewater treatment plant does have an observable negative impact on the water quality in the near field of the discharge and in the Liffey and Tolka Estuaries.
- The primary discharge from the wastewater treatment plant does not have an observable negative impact on the Water Framework Directive status in the Liffey Estuary. The DIN limit for Dublin Bay has been exceeded on occasion at 4 locations in 2020.
- Other potential causes of deterioration in water quality relevant to this area are upstream riverine pollutants, combined sewer overflows, exfiltration from sewers and misconnections to surface water sewers in the large urban agglomeration.

Licence D0034-01 requires monitoring and assessment of the impacts of the Ringsend effluent discharge on receiving water quality at agreed sampling locations as follows :

- 9 Ambient Surface Waters **(ASW2 – ASW10)** covering sampling points in the lower Liffey Estuary in the near field of the discharge **(ASW2 to ASW5)**, and points on the River Liffey and River Tolka **(ASW6 to ASW10 - Surface and Depth samples)**
- 11 additional monitoring points on the Liffey and Tolka Estuaries **(DB 020 to DB 420 – Surface, Depth and Composite samples)**
- 9 monitoring locations in Dublin Bay **(DB 430 to DB 610 – Surface, Depth and Composite samples)**
- 8 shoreline locations, 3 of which are EC designated bathing waters -Dollymount Bathing Zone, Sandymount and Merrion Strands **(ASW 11 to ASW 18)**

See map of monitoring locations agreed with the EPA in **Appendix 7.1.1.**

See all monitoring data for 2020 in **Appendix 7.1**.

The Liffey Estuary from Islandbridge Weir to the Poolbeg Lighthouse including the River Tolka Basin and the South Bull Lagoon is designated as a *"sensitive area*" by Part 2, Schedule 3, of the Urban Wastewater Regulations, SI 254 of 2001. S.I. .No. 272 of 2009 (as amended) / S.I. No. 77 of 2019, set physico-chemical standards for High and Good status in transitional and coastal water bodies to be complied with outside the allocated mixing zone of a licensed discharge.

The Rivers Liffey and Tolka and their estuaries are classified under the Water Framework Directive as Transitional Water Bodies. The outer estuary / Dublin Bay is classified as a Coastal Water Body.

The parameter suite set in the marine monitoring section of the licence was tested in all samples (Temperature / Dissolved Oxygen / BOD / Salinity / Dissolved Inorganic Nitrogen / Total Oxidised Nitrogen / Molybdate Reactive Phosphate / Ammonia / Silica / Chlorophyll).

3.2 REPORTED INCIDENTS SUMMARY

Environmental incidents that arise in an agglomeration are reported on an on-going basis in accordance with our waste water discharge licences. Where an incident occurs, and it is reportable under the licence, it is reported to the Environmental Protection Agency through their Environmental Data Exchange Network, or in some instances by telephone or fax. Some incidents which arise in the agglomeration are recorded by Irish Water but may not be reportable under our licence for example where the incident does not have an impact on environmental performance.

A summary of reported incidents is included below.

4.2 REPORT ON PROGRESS MADE AND PROPOSALS BEING DEVELOPED TO MEET THE IMPROVEMENT PROGRAMME REQUIREMENTS

4.2.1 SPECIFIED IMPROVEMENT PROGRAMME SUMMARY

A wastewater discharge licence may require a number of reports on specific subject areas to be prepared for the agglomeration in question. These reports are submitted to the EPA as part of the Annual Environmental Report. This section provides list of the various reports required for this agglomeration and a brief summary of their recommendations.

4.2.1a Specified Improvement Programme Summary - Dublin City Council Functional Area:

A summary of the status of any improvements identified by under Condition 5.2 is included below.

Specified Improvement Programmes (under Schedule A and C of WWDL)	Licence Schedule	Licence Completion Date	Date Expired? (N/NA/Y)	Status of Works	Timeframe for Completing the Work	Comments
Upgrade waste water treatment plant and ancillary works in accordance with Condition 5.5	C.1	22nd December 2015	Yes	Part-commenced	The project comprises four key elements and underpinning these is a substantial programme of ancillary works: • Provision of additional secondary treatment facility capacity with nutrient reduction (400,000 population equivalent). • Upgrade of the 24 existing secondary treatment tanks to provide additional capacity and nutrient reduction, which is essential	The overall Upgrade Project works are expected to take until 2025 to complete. The timeline for the production of effluent in line with the parameters set out in the UWWTD is now expected in Q4 2023, subject to the ongoing effects of Covid-19, and any associated restrictive work practices, timely procurement and investment approvals, as well as growth of loading in the catchment. The 400,000 PE Capacity Upgrade Design Build (DB) contract commenced in 2018. These works are at an advanced stage with testing and commissioning stages expected to be completed in Q4 2021. An Bord Pleanála granted planning permission for the further upgrade of the plant was granted on 24th April 2019, consenting for the works required to facilitate the use of the AGS technology in the existing treatment tanks and to omit construction of the Long Sea Outfall Tunnel. Works on the first of four contracts to retrofit the existing secondary treatment tanks with Aerobic Granular Sludge (AGS) technology commenced in November 2020. The award of the second contract is scheduled	start producing an effluent in line with the parameters set out in the UWWTD and the actual confirmed UWWTD compliance determination will be up to 12 months from that date (on attaining 12 months compliance with the UWWTD ELVs).

					for early Q3 2021, subject to Ministerial consent. The third and fourth contracts are scheduled to commence in late 2021 and mid 2023 respectively and will bring the plant capacity to 2.4m PE in 2025. Ministerial consent for the funding of the phosphorus recovery facility works was granted in December 2020 and the contract will commence in Q1 2021, with completion scheduled for the end of 2022. Initial upgrades to sludge treatment facilities commenced in 2020 and are scheduled to be completed in Q2 2021. Further elements are anticipated to progress towards the end of 2021 and continue into 2024. An interim stage in the project is to bring the plant into capability to produce a complaint effluent, based on a load of 2.1m PE, scheduled for the end of 2023.

5 LICENCE SPECIFIC REPORTS

A wastewater discharge licence may require a number of reports on specific subject areas to be prepared for the agglomeration in question. These reports are submitted to the EPA as part of the Annual Environmental Report. This section provides list of the various reports required for this agglomeration and a brief summary of their recommendations.

Licence Specific Report	Required by licence	Required in this AER	Included in this AER	Reference to relevant section of AER
Priority Substances Assessment	Yes	Yes	Yes	Summary of finding in **Table 5.1**. Full report in **Appendix 7.2**.

5.1 PRIORITY SUBSTANCES ASSESSMENT

The Priority Substances Assessment Report is included in **Appendix 7.2** . A summary of the findings of this report is included below.

Priority Substances Assessment	On-going review of licenced discharges to sewers in the catchment of Ringsend WWTP. Priority substances detected in effluent should have no negative impacts outside the near field of the discharge due to dilution. See **Appendix 7.2**.

5.2 TOXICITY/LEACHATE MANAGEMENT

The Toxicity of Toxicity/Leachate Management Repot is included in **Appendix 7.3** . A summary of the findings of this report is included below.

Toxicity/Leachate Management	Annual leachate volume at Ringsend is not significant at cubic metres. This constitutes 562 cubic metres per day (0.12 % v/v) based on the 2020 mean daily influent volume of 458,641 cubic metres. See **Appendix 7.3**.

5.3 TOXICITY OF FINAL EFFLUENT

The Toxicity of Final Effluent Report is included in **Appendix 7.4**. A summary of the findings of this report is included below.

Toxicity of Final Effluent Report	Treated effluent complies with the limit set in Licence of 5 TU. See **Appendix 7.4**.

Ringsend Influent and Effluent Priority Substances Screening 2020

To comply with condition **4.11.1** of Licence D0034-01, 2 sub-samples of the Ringsend composite influent and effluent were analysed in 2020 for a comprehensive suite of parameters from the:

- PRTR test suite
- EPA's 54 parameter test suite (Appendix 1, EPA Guidance on the Screening for Priority Substances for Waste Water Discharge Licences) which was issued on 17/01/11.

Summary of SBR Effluent Screening Results:

Effluent Sample Reference 1764792 taken on 21/10/20 .

See Table 7.2.1. Many of the parameters tested for the PRTR suite in this effluent sample were reported as below the detection limit.

Parameters from the EPA's Guidance document detected in this effluent sample are highlighted in **Table 7.2.1**. These included low (microgram and sub-microgram per litre) levels of :

Plasticisers : Di(2-ethylhexyl)phthalate (DEHP) was detected at 8.3 ug/l.

Pesticides : Glyphosate (1.01 ug/l), Mecoprop (0.08 ug/l), 2,4- D (0.10 ug/l), MCPA (0.12 ug/l), Diazinon (0.007 ug/l) and Terbutryn (0.031 ug/l) were detected in the effluent sample.

The only one of these 5 compounds detected in the Influent sample was Glyphosate. See below.

Metals : The metals Lead (8.0 ug/l), Arsenic (1.8 ug/l), Copper (25 ug/l), Zinc (269 ug/l), Antimony (1.7 ug/l), Tin (24.0 ug/l), Barium (20.9 ug/l), and Nickel (6.0 ug/l) were detected in the effluent sample.

These were all detected in the Influent sample except Tin. See below.

Results for other general parameters and additional tests were in the normal range for effluent sewage.

Assessment of the Significance of the Discharge SW1 on Receiving Water Quality – 2020

A summary of effluent screening results is presented below with a limited assessment of the significance of the discharge on receiving water. Note that the SBR effluent results are sampled at the licensed point of discharge (SW1) and that a mixing zone boundary has not been defined in WWDL D0034-01.

SBR Effluent from SW1 receives a significant dilution within the undefined near field mixing zone before receiving water standards are applicable.

Chromium (Total), Copper and Zinc were the only metals screened in the effluent sample that exceeded the EQS's set for the receiving waters. Diazinon was close to the annual average (AA) EQS.

A minimum dilution factor of 2 to 6 in the near field mixing zone allows for compliance with the EQS's for specific pollutants which are set as an annual average (AA).

This assessment does not indicate a significant impact from the specific pollutants listed for the receiving waters outside the near field of the SW1 discharge point.

Table 7.2.2 Assessment of the Significance of the Discharge SW1 on Receiving Water Environmental Quality Standards for Specific Pollutants (Table 10, S.I. No. 272 of 2009)

Ringsend Influent Screening 2020

To comply with condition **4.11.2 of Licence D0034-01**, a sample of the Ringsend influent was analysed during 2020 (on 21/10/20) – same date as the effluent sample reported above, for agglomeration regulation purposes.

Investigation of the sources of any dangerous substances detected in monitoring of the influent was carried out by monitoring the 4 incoming lines to the plant on 21/10/20.

Samples were tested for:

- PRTR test suite
- EPA's 54 parameter test suite (Appendix 1, EPA Guidance on the Screening for Priority Substances for Waste Water Discharge Licenses) issued on 17/01/11.

Summary of Influent Screening Results:

2020– Influent Sample Reference 1764791 of 21/10/20.

See **Table 7.2.3.** Many of the parameters tested for the PRTR suite in this influent sample were reported as below the detection limit.

Parameters from the EPA's Guidance document detected in this influent sample included low (sub-microgram and microgram per litre) concentrations of :

VOCs : Tri-chloromethane (2.72 ug/l),

BTEX Compounds : Toluene (2.32 ug/l).

PAH's : All PAH's were reported at <20.0 ug/l.

Herbicides / Pesticides : Glyphosate (1.27 ug/l).

Phenols : Phenol (35.3 ug/l).

Cresols : m,p-Methylphenol was detected (70.3 ug/l).

Metals : The metals Lead (11 ug/l), Arsenic (2.4 ug/l), Copper (57 ug/l), Zinc (1080 ug/l), Chromium (6 ug/l),Selenium (0.6 ug/l), Antimony (2.6 ug/l), Molydenum (6 ug/l), Barium (30.5 ug/l), Boron (280 ug/l) and Nickel (31 ug/l) were detected.

See highlighted parameters in **Table 7.2.3**.

Results for general parameters and additional tests were in the normal range for influent sewage.

Summary of Influent Lines Screening Results 2020:

2020– Influent Lines - Sample References 1764793, 1764794, 1764795 and 1764796 all sampled on 21/10/20.

To isolate the source of parameters detected in the Influent, samples were taken from the 4 main influent feeder lines on 21/10/20 as follows:

- 1514431: Dun Laoghaire – West Pier
- 1514330: Dodder Valley Sewer - UCD FM-10
- 1514432: North Dublin Drainage System – Sutton Sump
- 1514218: Ringsend – Main Lift Pumping Station

See **Table 7.2.4.** These samples were tested for the PRTR test suite. Many of the parameters in the influent feeder line samples were reported as below the detection limit.

Parameters detected in the 4 feeder lines have been compared with those detected in the influent sample (see **Table 7.2.3** above).

Appendix 7.3 - Toxicity Leachate Management Report

Leachate received by tanker at the Ringsend WWTP is managed using a system of application forms, consignment notes, monitoring and invoicing. Leachate is also discharged to sewer and this is managed by consent to discharge. A total volume of 205,686 cubic metres of leachate was received in 2020 as tabulated below:

Landfill Source	Local Authority Source	Leachate Annual Volume 2020 (m^3/yr)	PE Load (using volume)	% Load to WWTP
Ballynagran (by tanker)	Wicklow County Council	20,024	243.16	0.013%
Kerdiffstown (by tanker)	Kildare County Council	12,572	152.67	0.008%
Bord Na Mona Drehid Landfill (by tanker)	Kildare County Council	9,214	111.89	0.006%
Knockharley Landfill (by tanker)	Meath County Council	12,298	149.34	0.008%
Dunsink Civic Amenity (to sewer)	Fingal County Council	151,578	1,840.66	0.096%
Total		**205,686**	**2,498**	**0.13%**

The daily leachate PE load represents < **0.13 %** of the average daily calculated PE load in 2020 (**1,899,072 PE**).

* PE = m^3/year /0.225 x 366

** % Load to WWTP = m^3/year x 100 / current Hydraulic Capacity (m^3/yr)

This sample complied with the EPA WWTP Licence.

Toxicity Testing Report on behalf of
TMS Environment Ltd.

Sampling Date – 21st October 2020

Sample Details

TMS Environment Limited requested toxicity testing on behalf of their client, Dublin City Council, on their final effluent in October 2020.

The customer collected a composite sample over a 24 hour period on Tuesday, the 20th of October, and the sample was collected by Enva on Wednesday the 21st of October.

The sample was labelled as "Effluent.", and was to be tested on the following species;

- 30 Minutes EC50 to *Vibrio fischeri*
- 48 Hours LC50 to *Brachionus Plicatilis*

Methods

Method 1: ENVCM.136: Based on ISO 11348-3:2007 Determination of the inhibitory effect of water sample on the light emission of *Vibrio fischeri*.

ISO 11348 describes three methods for determining the inhibition of the luminescence emitted by the marine bacterium *Vibrio fischeri* (NRRL B-11177). ISO 11348-3:2007 specifies a method using freeze-dried bacteria.

This method is applicable to waste water, fresh water (surface and ground water), sea and brackish water.

Method 2: ENVCM.137: Rotifer *Brachionus plicatilis*: Based on ASTM E1440-91.

This guide describes procedures for obtaining laboratory data concerning the acute toxicity of chemicals and aqueous effluents released into estuarine or marine waters. Acute toxicity is measured by exposing *Brachionus* newly hatched from cysts to a series of toxicant concentrations under controlled conditions.

The *Brachionus plicatilis* rotifer is specific to sea and brackish water.
