Cause of Exceedance(s):

The non-compliances were due to capacity issues and ongoing works at the WWTP.

Significance of Results:

The WWTP was non-compliant with the ELV's set in the wastewater discharge licence. There were 68 samples non-compliant with the ELV in relation to cBOD. The non-compliance is due to overloading. There were 71 samples non-compliant with the ELV in relation to COD. The non-compliance is due to overloading. There were 169 samples non-compliant with the ELV in relation to TSS. The non-compliance is due to overloading. There were 100 samples non-compliant with the ELV for TP. The non-compliance was due to no P removal treatment on site. There were 91 samples non-compliant with the ELV for TN. The non-compliance was due to overloading. The WWTP effluent was compliant with the pH and Toxicity ELVs set in the wastewater discharge licence. The WWTP was non-compliant with the ELV set in the wastewater discharge licence for Faecal Coliforms (E. Coli) monitored during the specified period 01/05/20 to 31/08/20 (2 breaches). The two breaches of the Condition 2 ELV occurred on the 29/06/2021 (241,960 MPN/100ml) and the 20/07/2021 (198,630 MPN/100 ml).

The impact on receiving waters is assessed further in Section 2.3.

2.1.3.1 AMBIENT MONITORING PARAMETER SUMMARY-RINGSEND WWTP

The results for ambient results and additional monitoring data sets are included in the **Appendix 7.1 - Ambient Monitoring Summary**.

Significance of Results:

- The Ringsend WWTP was non-compliant with the ELV's set in the wastewater discharge licence as detailed in **Section 2.1.2**.
- The primary discharge from the wastewater treatment plant does have an observable negative impact on the water quality in the near field of the discharge and in the Liffey and Tolka Estuaries.
- The primary discharge from the wastewater treatment plant does not have an observable negative impact on the Water Framework Directive status in the Liffey Estuary and Dublin Bay. The DIN limit for Dublin Bay has been exceeded on occasion at 4 locations in 2021.
- Other potential causes of deterioration in water quality relevant to this area are upstream riverine pollutants, combined sewer overflows, exfiltration from sewers and misconnections to surface water sewers in the large urban agglomeration.

Licence D0034-01 requires monitoring and assessment of the impacts of the Ringsend effluent discharge on receiving water quality at agreed sampling locations as follows :

- 9 Ambient Surface Waters **(ASW2 – ASW10)** covering sampling points in the lower Liffey Estuary in the near field of the discharge **(ASW2 to ASW5)**, and points on the River Liffey and River Tolka **(ASW6 to ASW10 - Surface and Depth samples)**
- 11 additional monitoring points on the Liffey and Tolka Estuaries **(DB 020 to DB 420 – Surface, Depth and Composite samples)**
- 9 monitoring locations in Dublin Bay **(DB 430 to DB 610 – Surface, Depth and Composite samples)**
- 8 shoreline locations, 2 of which are EC designated bathing waters - Dollymount Bathing Zone and Sandymount **(ASW 11 to ASW 18)**

See map of monitoring locations agreed with the EPA in **Appendix 7.1.1**.

See all monitoring data for 2021 in **Appendix 7.1**.

The Liffey Estuary from Islandbridge Weir to the Poolbeg Lighthouse including the River Tolka Basin and the South Bull Lagoon is designated as a *"sensitive area*" by Part 2, Schedule 3, of the Urban Wastewater Regulations, SI 254 of 2001. S.I. .No. 272 of 2009 (as amended) / S.I. No. 77 of 2019, set physico-chemical standards for High and Good status in transitional and coastal water bodies to be complied with outside the allocated mixing zone of a licensed discharge.

The Rivers Liffey and Tolka and their estuaries are classified under the Water Framework Directive as Transitional Water Bodies. The outer estuary / Dublin Bay is classified as a Coastal Water Body.

The parameter suite set in the marine monitoring section of the licence was tested in all samples (Temperature / Dissolved Oxygen / BOD / Salinity / Dissolved Inorganic Nitrogen / Total Oxidised Nitrogen / Molybdate Reactive Phosphate / Ammonia / Silica / Chlorophyll).

Tidal Conditions during the 6 monthly estuarine surveys in **2021** are tabulated below:

2.1.4 OPERATIONAL PERFORMANCE SUMMARY - RINGSEND WWTP

2.1.4.1 Treatment Efficiency Report - Ringsend WWTP

Treatment efficiency is based on the removal of key pollutants from the influent wastewater by the treatment plant. In essence the calculation is based on the balance of load coming into the plant versus the load leaving the plant. The efficiency is presented as a percentage removal rate.

A summary presentation of the efficiency of the treatment process including information for all the parameters specified in the licence is included below:

Parameter	Influent mass loading (kg/year)	Effluent mass emission (kg/year)	Efficiency (% reduction of influent load)
cBOD	40,933,118	5,545,951	86
COD	84,487,889	22,168,185	74
SS	38,507,165	1,2281,231	68
TN	6,407,843	3,339,141	48
TP	834,654	678,633	19

2.1.4.2 Treatment Capacity Report Summary - Ringsend WWTP

Treatment capacity is an assessment of the hydraulic (flow) and organic (the amount of pollutants) load a treatment plant is designed to treat versus the current loading of that plant.

Ringsend WWTP	
Peak Hydraulic Capacity (m^3/day) - As Constructed	959,040
DWF to the Treatment Plant (m^3/day)	397,440
Current Hydraulic Loading - annual max (m^3/day)	864,774
Average Hydraulic loading to the Treatment Plant (m^3/day)	430,893
Organic Capacity (PE) - As Constructed	1,640,000
Organic Capacity (PE) - Collected Load (peak week)[Note1]	2,231,358
Organic Capacity (PE) - Remaining	0
Will the capacity be exceeded in the next three years? (Yes/No)	Yes

Nominal design capacities can be based on conservative design principles. In some cases, assessment of existing plants has shown organic capacities significantly higher than the nominal design capacity. Accordingly, plants that appear to be overloaded when comparing a collected peak load with the nominal design capacity can be fully compliant due to the safety factors in the original design.

SLUDGE / OTHER INPUTS - RINGSEND WWTP

'*Other inputs'* to the waste water treatment plant are summarised in table below.

3.2 REPORTED INCIDENTS SUMMARY

Environmental incidents that arise in an agglomeration are reported on an on-going basis in accordance with our waste water discharge licences. Where an incident occurs and it is reportable under the licence, it is reported to the Environmental Protection Agency through their Environmental Data Exchange Network, or in some instances by telephone. Some incidents which arise in the agglomeration are recorded by Irish Water but may not be reportable under our licence for example where the incident does not have an impact on environmental performance.

A summary of reported incidents is included below.

4.2 REPORT ON PROGRESS MADE AND PROPOSALS BEING DEVELOPED TO MEET THE IMPROVEMENT PROGRAMME REQUIREMENTS

4.2.1 SPECIFIED IMPROVEMENT PROGRAMME SUMMARY

A wastewater discharge licence may require a number of reports on specific subject areas to be prepared for the agglomeration in question. These reports are submitted to the EPA as part of the Annual Environmental Report. This section provides a list of the various reports required for this agglomeration and a brief summary of their recommendations.

4.2.1a Specified Improvement Programme Summary - Dublin City Council Functional Area:

A summary of the status of any improvements identified by under Condition 5.2 is included below.

Specified Improvement Programmes (under Schedule A and C of WWDL)	Licence Schedule	Licence Completion Date	Date Expired? (N/NA/Y)	Status of Works	Timeframe for Completing the Work	Comments
Upgrade waste water treatment plant and ancillary works in accordance with Condition 5.5	C.1	22nd December 2015	Yes	Part-commenced	The project comprises four key elements and underpinning these is a substantial programme of ancillary works: • Provision of additional secondary treatment facility capacity with nutrient reduction (400,000 population equivalent). • Upgrade of the 24 existing secondary treatment tanks to provide additional capacity and nutrient reduction, which is essential	The overall Upgrade Project works are expected to take until 2025 to complete. The timeline for the production of effluent in line with the parameters set out in the UWWTD is now expected in Q4 2023, subject to the ongoing effects of Covid-19, supply chain challenges (Ukraine) and timely procurement and investment approvals, as well as growth of loading in the catchment. It is important to note that this programmed 2023 date is the anticipated date that the plant can start producing an effluent in line with

					to protect the nutrient-sensitive Dublin Bay area. • Provision of a new phosphorous recovery process; and • Expansion of the plant's sludge treatment facilities. The 400,000 PE Capacity Upgrade Design Build (DB) contract commenced in 2018. These works progressed through the testing and commissioning stages and were completed in Q4 2021. An Bord Pleanála granted planning permission for the further upgrade of the plant was granted on 24th April 2019, consenting for the works required to facilitate the use of the AGS technology in the existing treatment tanks and to omit construction of the Long Sea Outfall Tunnel. Works on the first of four contracts to retrofit the existing secondary treatment tanks with Aerobic Granular Sludge (AGS) technology commenced in November 2020. The second	the parameters set out in the UWWTD and the actual confirmed UWWTD compliance determination will be up to 12 months from that date (on attaining 12 months compliance with the UWWTD ELVs).

					contract was awarded in Q3 2021. The third contract was awarded in Q4 2021, and fourth contract is scheduled to commence in Q1 2024. All 4 contracts will bring the plant capacity to 2.4m PE in 2025. The phosphorus recovery facility works contract commenced in Q1 2021, with completion scheduled for early 2023. Initial upgrades to sludge treatment facilities commenced in 2020 and were completed in Q2 2021. Further elements progressed in 2021 and will continue into 2024. An interim stage in the project is to bring the plant into capability to produce a complaint effluent, based on a load of 2.1m PE, scheduled for the end of 2023.	
Upgrade storm water storage tank at WWTP as necessary	C.1	22nd December 2015	Yes		There are no current plans to upgrade the storm water storage tanks at the Works. This will be reassessed on completion of the drainage areas plans where network is currently being considered under the model solution.	The four drainage area plans under investigation are for the MLPS, Sutton, Dodder Valley and West pier catchments.

Assessment of the Significance of the Discharge SW1 on Receiving Water Quality - 2021

A summary of effluent screening results is presented below with a limited assessment of the significance of the discharge on receiving water. Note that the SBR effluent results are sampled at the licensed point of discharge (SW1) and that a mixing zone boundary has not been defined in WWDL D0034-01.

SBR Effluent from SW1 receives a significant dilution within the undefined near field mixing zone before receiving water standards are applicable.

Chromium (Total), Copper and Zinc were the only metals screened in the effluent sample that exceeded the EQS's set for the receiving waters. Diazinon was close to the annual average (AA) EQS.

A minimum dilution factor of 2 to 6 in the near field mixing zone allows for compliance with the EQS's for specific pollutants which are set as an annual average (AA).

This assessment does not indicate a significant impact from the specific pollutants listed for the receiving waters outside the near field of the SW1 discharge point.

Table 7.2.2 Assessment of the Significance of the Discharge SW1 on Receiving Water Environmental Quality Standards for Specific Pollutants (Table 10, S.I. No. 272 of 2009, as amended)

Ringsend Influent Screening 2021

To comply with condition **4.11.2 of Licence D0034-01**, a sample of the Ringsend influent was analysed during 2021 (on 01/12/21) – same date as the effluent sample reported above, for agglomeration regulation purposes.

Investigation of the sources of any dangerous substances detected in monitoring of the influent was carried out by monitoring the 4 incoming lines to the plant on 01/12/21.

Samples were tested for:

- PRTR test suite
- EPA's 54 parameter test suite (Appendix 1, EPA Guidance on the Screening for Priority Substances for Waste Water Discharge Licenses) issued on 17/01/11

Summary of Influent Screening Results:

2021– Influent Sample Reference 1909232 of 01/12/21.

See **Table 7.2.3.** Many of the parameters tested for the PRTR suite in this influent sample were reported as below the detection limit.

Parameters from the EPA's Guidance document detected in this influent sample included low (sub-microgram and microgram per litre) concentrations of:

VOCs and BTEX compounds:

- Tri-chloromethane was detected at 4.21 ug/l.
- Benzene was detected at 0.17 ug/l.
- Xylenes (all isomers) were detected at 0.53 ug/l.
- Ethyl Benzene was detected 0.15 ug/l.
- Toluene was detected at 3.11 ug/l.

PAH's: Naphthalene (0.411 ug/l) and Phenanthrene (0.137 ug/l) were detected. All other PAH's were reported as below the detection limit.

Phenols : Phenols were detected at 163 ug/l.

Cresols: M,p-Methylphenol was detected at 381 ug/l.

Metals: The metals Lead (13 ug/l), Arsenic (2.8 ug/l), Copper (71 ug/l), Zinc (267 ug/l),Mercury (0.037 ug/l), Chromium (9 ug/l), Selenium (1.1 ug/l), Molydenum (19 ug/l), Barium (47.4 ug/l), Boron (0.24 mg/l), Cobalt (0.002 mg/l) and Nickel (11 ug/l) were detected.

See highlighted parameters in **Table 7.2.3**.

Results for general parameters and additional tests were in the normal range for influent sewage.

Summary of Influent Lines Screening Results 2021:

2021 – Influent Lines - Sample References 1909412, 1909413, 1909414 and 1909415 all sampled on 01/12/2021

To isolate the source of parameters detected in the Influent, samples were taken from the 4 main influent feeder lines on 01/12/21 as follows:

Appendix 7.3 - Toxicity Leachate Management Report

Leachate received by tanker at the Ringsend WWTP is managed using a system of application forms, consignment notes, monitoring and invoicing.

Leachate is also discharged to sewer, and this is managed by consent to discharge.

A total volume of **182,216** cubic metres of leachate was received in 2021 as tabulated below:

Landfill Source	**Local Authority**	**Leachate Annual Volume 2021 (m^3)**	**Daily PE Load (using volume)**	**Daily % Influent PE Load***
Ballynagran (by tanker)	Wicklow County Council	15,507	189	0.0102%
Kerdiffstown (by tanker)	Kildare County Council	14,056	171	0.0092%
Bord Na Mona Drehid Landfill (by tanker)	Kildare County Council	5,002	61	0.0033%
Knockharley Landfill (by tanker)	Meath County Council	4,158	51	0.0027%
Dunsink (to sewer)	Fingal County Council	128,893	1,569	0.0844%
Arthurstown (to sewer)	South Dublin County Council	14,600	178	0.0096%
Total		**182,216**		**0.12%**

The daily leachate PE load represents **0.12 %** of the average daily calculated PE load in 2021 (**1,859,465 PE**)

This sample complied with the EPA WWTP Licence.

Toxicity Testing Report on behalf of TMS Environment Ltd.

Sampling Date – 01st December 2021

Sample Details

TMS Environment Limited requested toxicity testing on behalf of their client, Dublin City Council, on their final effluent in December 2021.

The customer collected a composite sample over a 24 hour period on Wednesday, the 01st of December, and the sample was received by Enva on Thursday the 2nd of December.

The sample was labelled as "Ringsend Effluent 01.12.21.", and was to be tested on the following species;

- 30 Minutes EC50 to *Vibrio fischeri*
- 48 Hours LC50 to *Brachionus Plicatilis*

Methods

Method 1: ENVCM.136: Based on ISO 11348-3:2007 Determination of the inhibitory effect of water sample on the light emission of *Vibrio fischeri*.

ISO 11348 describes three methods for determining the inhibition of the luminescence emitted by the marine bacterium *Vibrio fischeri* (NRRL B-11177). ISO 11348-3:2007 specifies a method using freeze-dried bacteria.

This method is applicable to waste water, fresh water (surface and ground water), sea and brackish water.

Method 2: ENVCM.137: Rotifer *Brachionus plicatilis*: Based on ASTM E1440-91.

This guide describes procedures for obtaining laboratory data concerning the acute toxicity of chemicals and aqueous effluents released into estuarine or marine waters. Acute toxicity is measured by exposing *Brachionus* newly hatched from cysts to a series of toxicant concentrations under controlled conditions.

The *Brachionus plicatilis* rotifer is specific to sea and brackish water.
